Betrayal of Reputation

Trusting the Untrustable Hardware and Software with Reputation

Seunghun Han

Senior Security Researcher at National Security Research Institute

29 May 2019

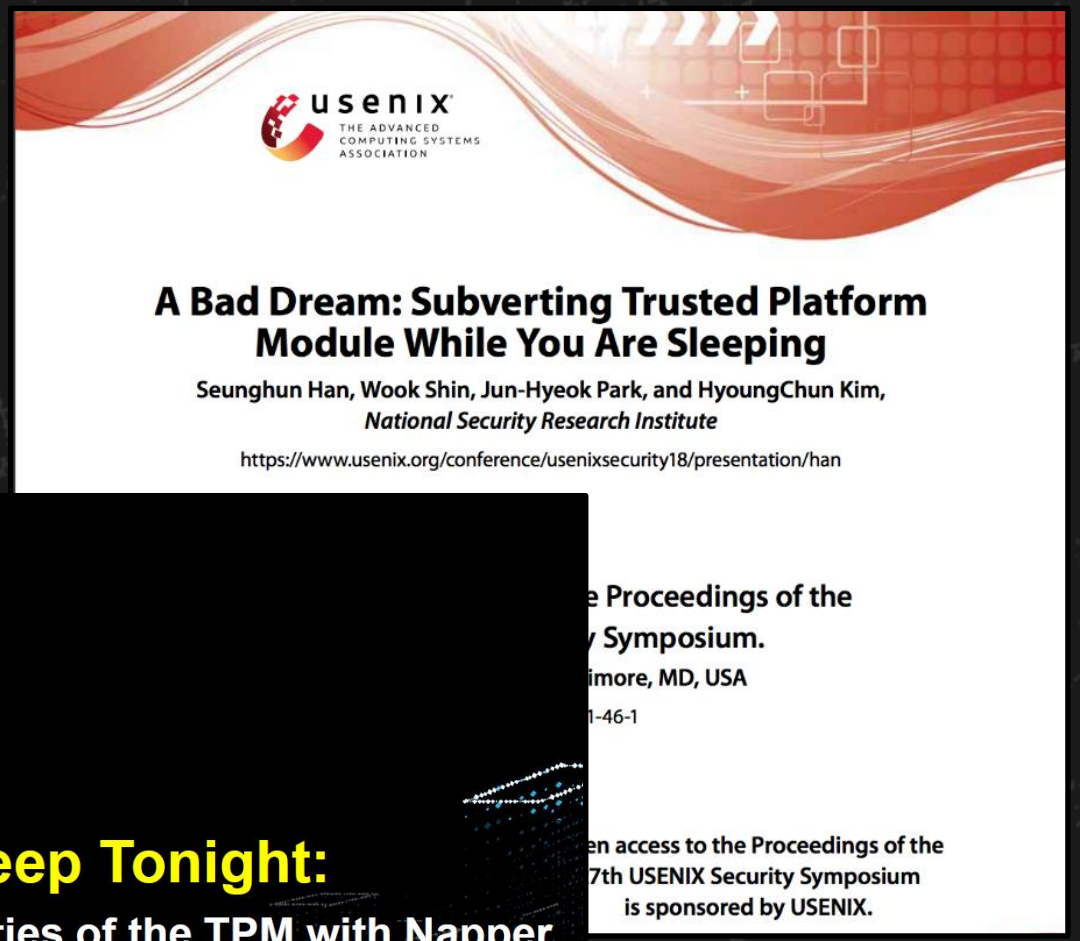
Who Am I?

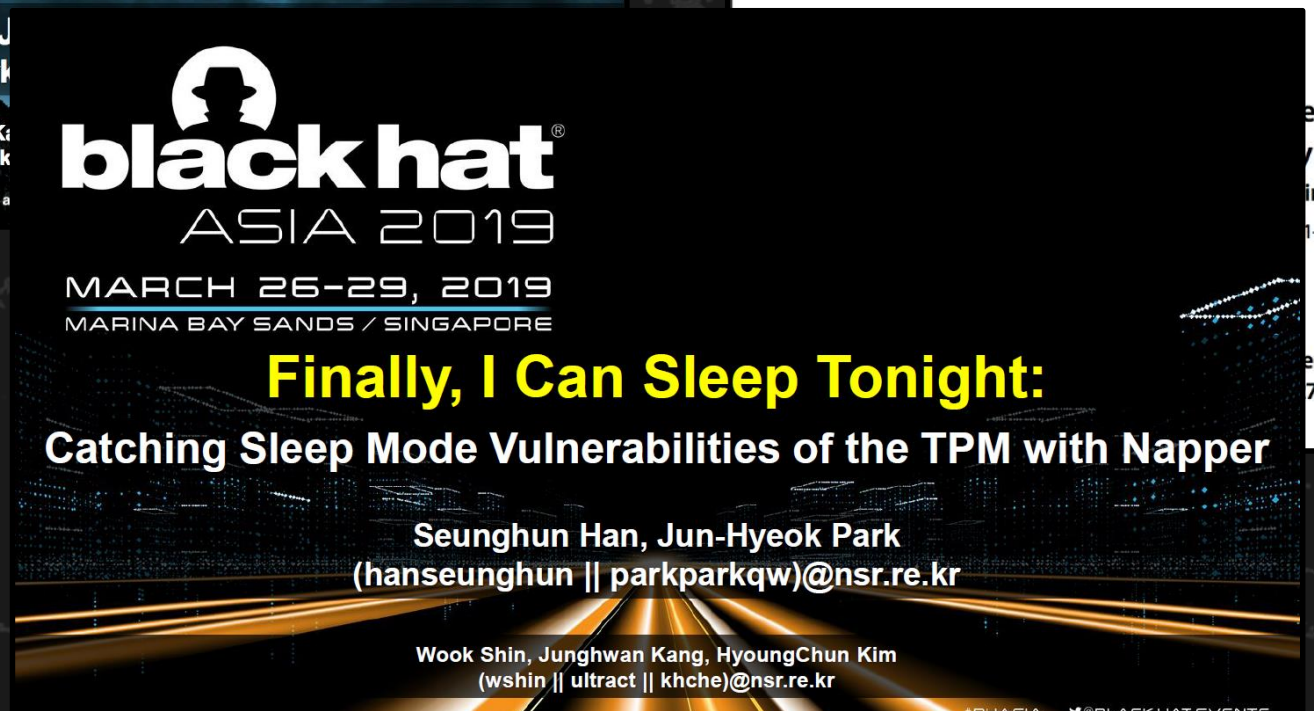
- **Senior security researcher** at NSR (National Security Research Institute of South Korea)
- **Influencer Member** of Black Hat Asia 2019
- **Review Board Member** of KIMCHICON
- **Speaker** at
  - USENIX Security 2018
  - Black Hat Asia 2017 - 2019
  - HITBSecConf 2016 - 2017
  - BeVX and KIMCHICON 2018
- **Author** of “64-bit multi-core OS principles and structure, Vol. 1 and Vol. 2)
- a.k.a kkamagui **@kkamagui1**

Goal of This Talk

- **I introduce a stereotype about reputation**
  - **REPUTATION does not mean TRUSTWORTHINESS!**
  - Unfortunately, we easily trust something because of **REPUTATION!**
- **I present the case that the reputation betrays you**
  - BIOS/UEFI firmware and Trusted Platform Module (TPM) were made by **REPUTABLE** companies!
  - However, I found two vulnerabilities, CVE-2017-16837 and CVE-2018-6622, that can subvert the TPM
- **I present countermeasures and what we should do**
  - Trust nothing with **REPUTATION** and check everything for yourself!

Previous Works





Reputation

is based on

trust!

We just **believe**

products

Family "2.0"

Level 00 Revision 01.38

September 29, 2016

Root of Trust for Measurement

Core RTM

Trusted Building Block

9.2.5 Trust Authority

When the RTM begins to execute the CRTM, the entity that may vouch for the correctness of the TBB is the entity that created the TBB. For typical systems, this is the platform manufacturer. In other words, the manufacturer is the authority on what constitutes a valid TBB, and its reputation is what allows someone to trust a given TBB.

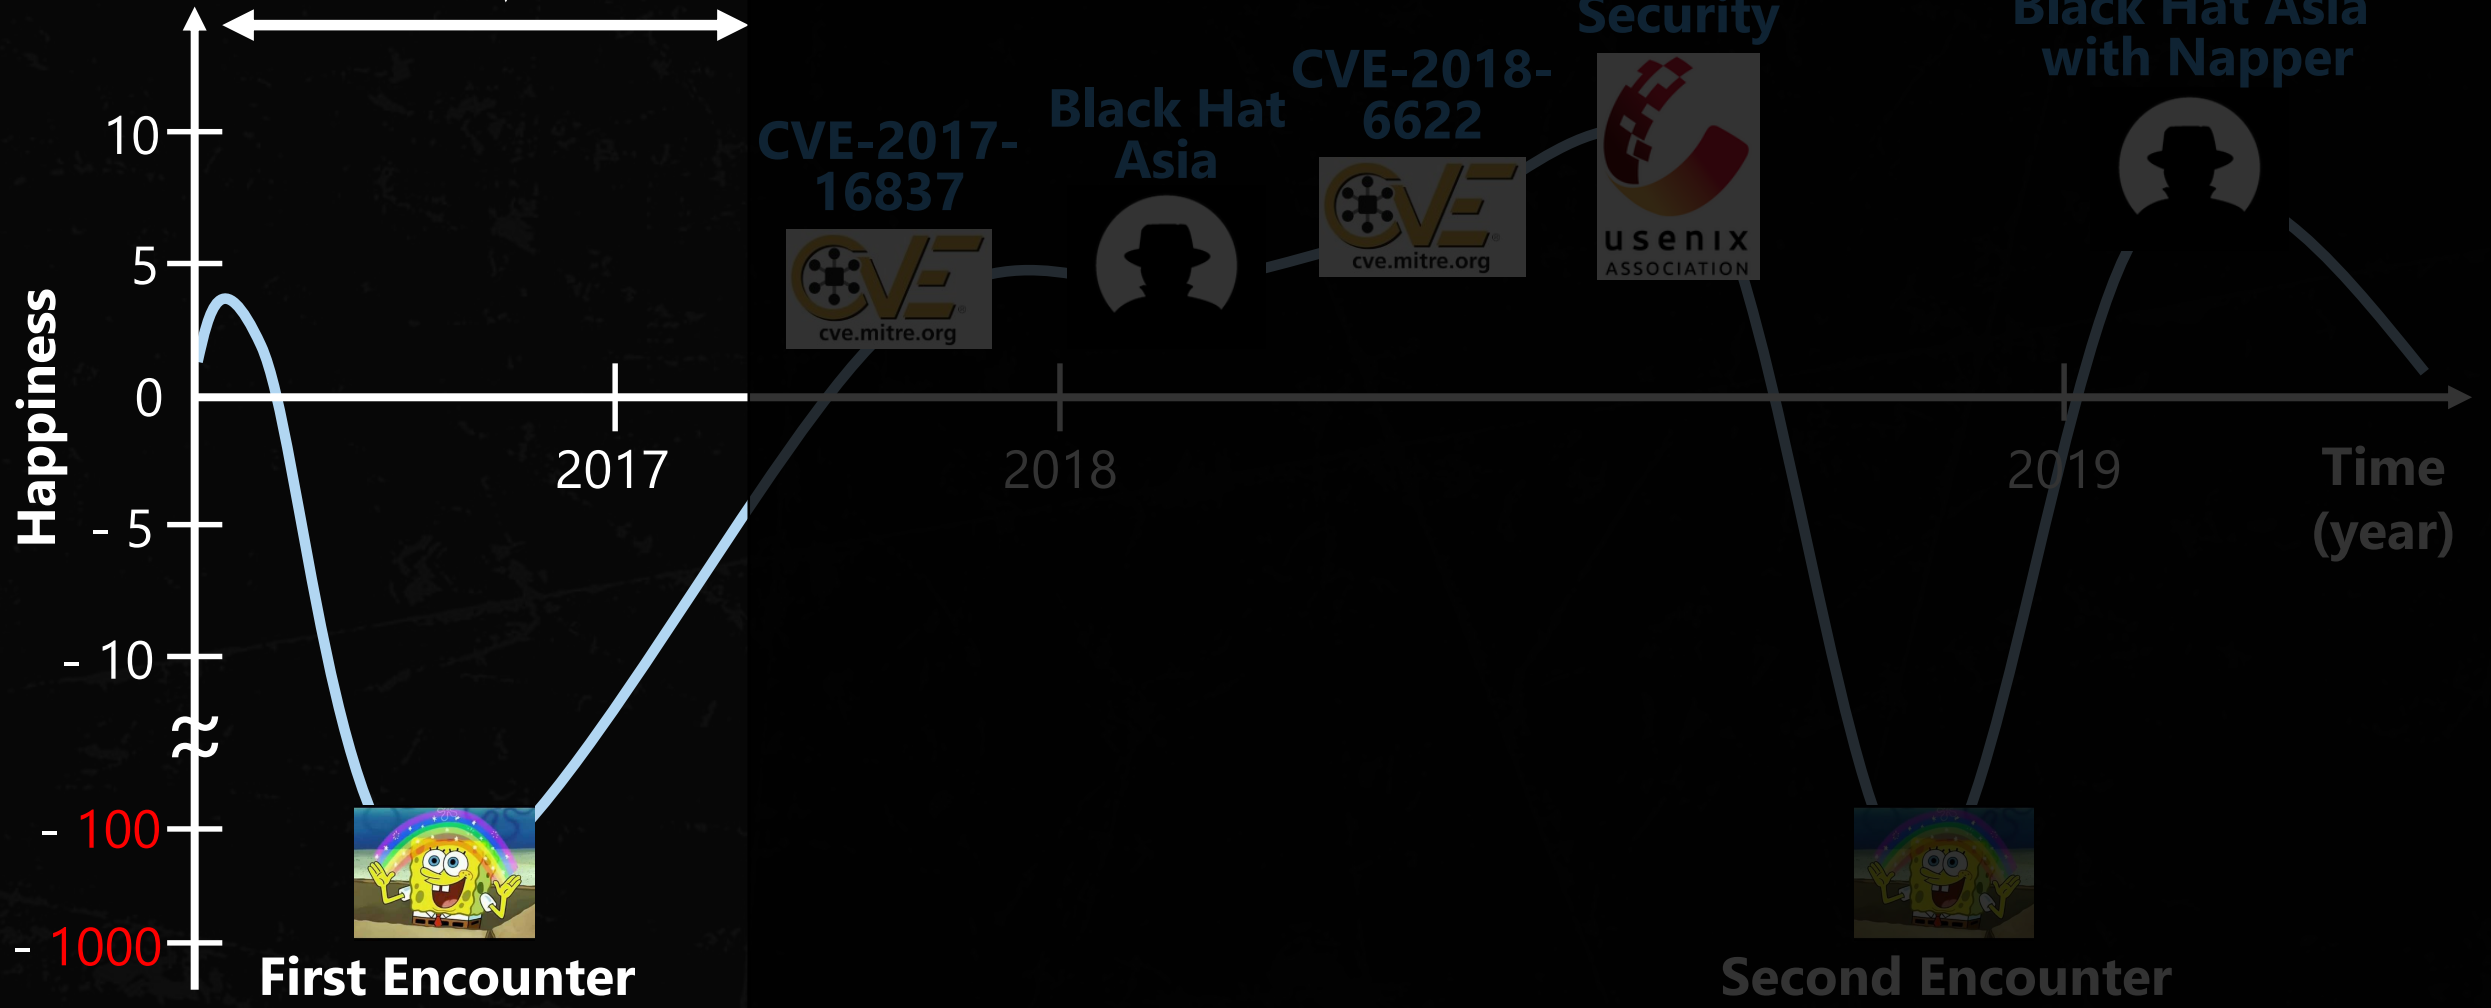
Contents - Background



Trusted Computing Group (TCG)

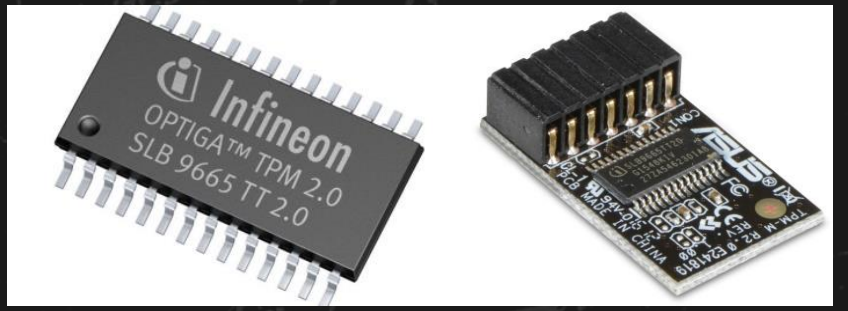
- **Defines global industry specifications and standards**
  - All reputable companies such as Intel, AMD, IBM, HP, Dell, Lenovo, Microsoft, Cisco, Juniper Networks, and Infineon are members of it
- **Is supportive of a hardware root of trust**
  - Trusted Platform Module (TPM) is the core technology
  - TCG technology has been applied to Unified Extensible Firmware Interface (UEFI)

Trusted Computing Base (TCB) of TCG

- **Is a collection of software and hardware on a host platform**
- **Manages and enforces a security policy of the system**
- **Is able to prevent itself from being compromised**
  - The Trusted Platform Module (TPM) helps to ensure that the TCB is properly instantiated and trustworthy

Trusted Platform Module (TPM) (1)

- **Is a tamper-resistant device**
- **Has own processor, RAM, ROM, and non-volatile RAM**
  - It has own state separated from the system
- **Provides cryptographic and accumulating measurements functions**
  - Measurement values are accumulated to Platform Configuration Registers (PCR #0~#23)



Trusted Platform Module (TPM) (2)

- **Is used to determine the trustworthiness of a system by investigating the values stored in PCRs**
  - A local verification or remote attestation can be used
- **Is used to limit access to secret data based on specific PCR values**
  - “Seal” operation encrypts secret data with the PCRs of the TPM
  - “Unseal” operation can decrypt the sealed data only if the PCR values match the specific values

Root of Trust for Measurement (RTM)

- **Sends integrity-relevant information (measurements) to the TPM**
  - TPM accumulates the measurements to a PCR with the previously stored value in the PCR

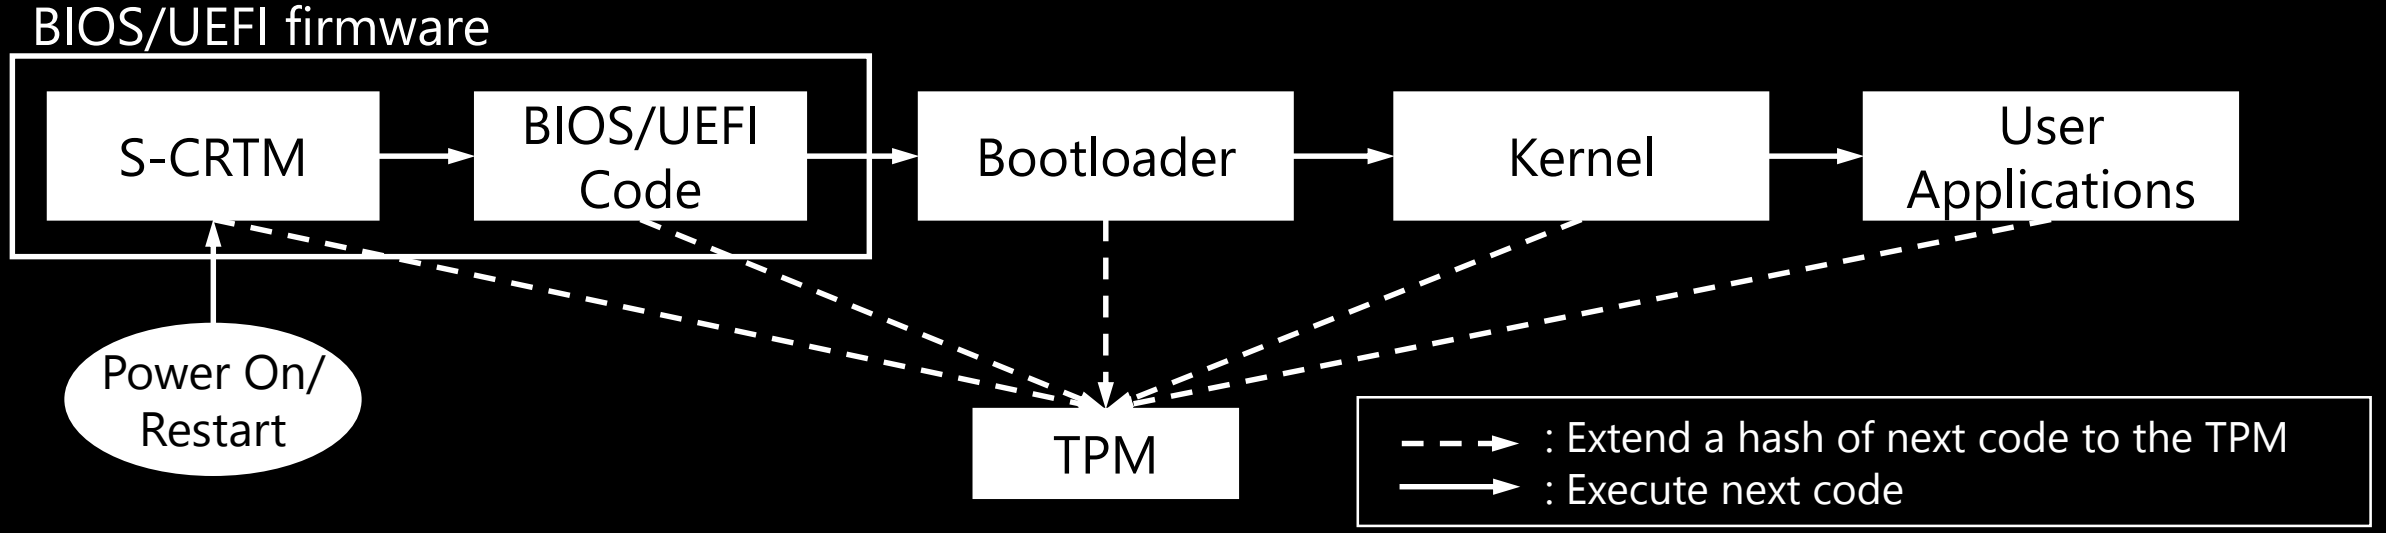
Extend: $PCR_{new} = Hash(PCR_{old} || Measurement_{new})$

- **Is the CPU controlled by Core RTM (CRTM)**
  - The CRTM is the first set of instructions when a new chain of trust is established

Static and Dynamic RTM (SRTM and DRTM)

- SRTM is started by static CRTM (S-CRTM) when the host platform starts at POWER-ON or RESTART
- DRTM is started by dynamic CRTM (D-CRTM) at runtime WITHOUT platform RESET
- They extend measurements (hashes) of components to PCRs BEFORE passing control to them

Static Root of Trust for Measurement (SRTM)



Dynamic Root of Trust for Measurement (DRTM)

(Intel Trusted Execution Technology)

SRTM
DRTM

PCR Protection

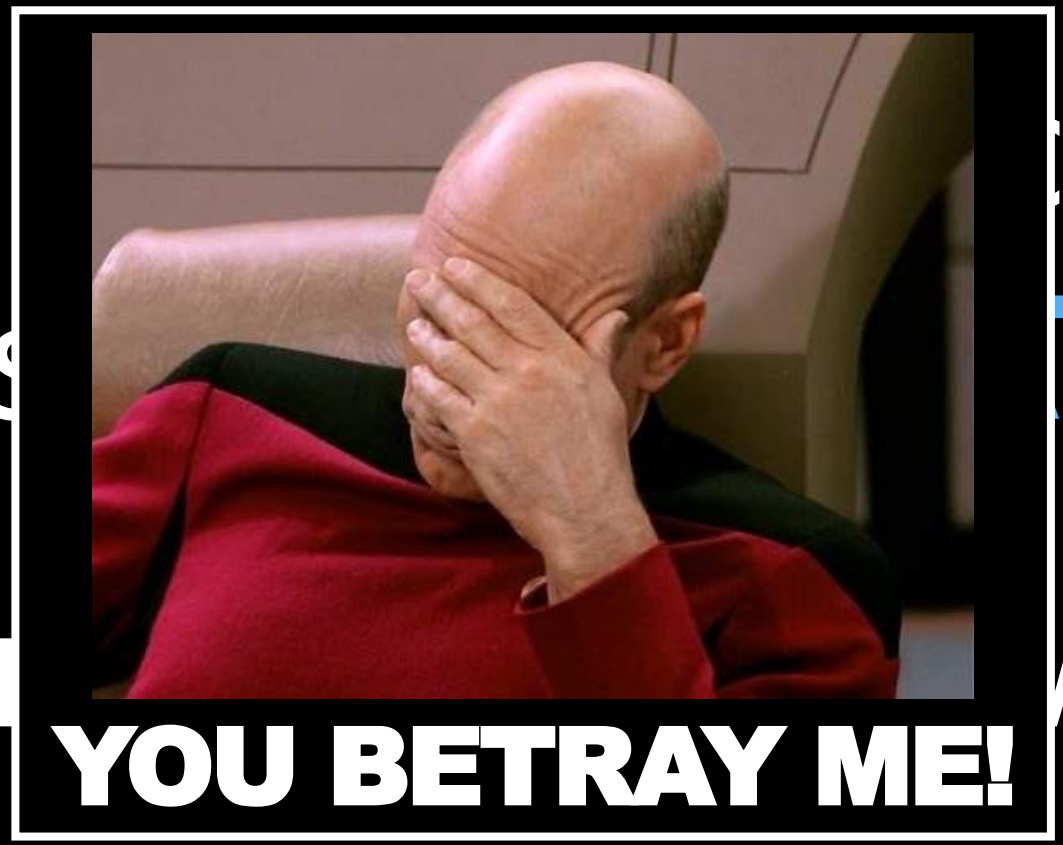
- **They MUST NOT be reset by disallowed operations even though an attacker gains a root privilege!**
  - Static PCRs (PCR #0~#15) can be reset only if the host resets
  - Dynamic PCRs (PCR #17~#22) can be reset only if the host initializes the DRTM
- **If PCRs are reset by attackers, they can reproduce specific PCR values by replaying hashes**
  - They can steal the secret and deceive the local and remote verification

We trust all these mechanisms because of **REPUTATION**!

Fortunately, they worked!

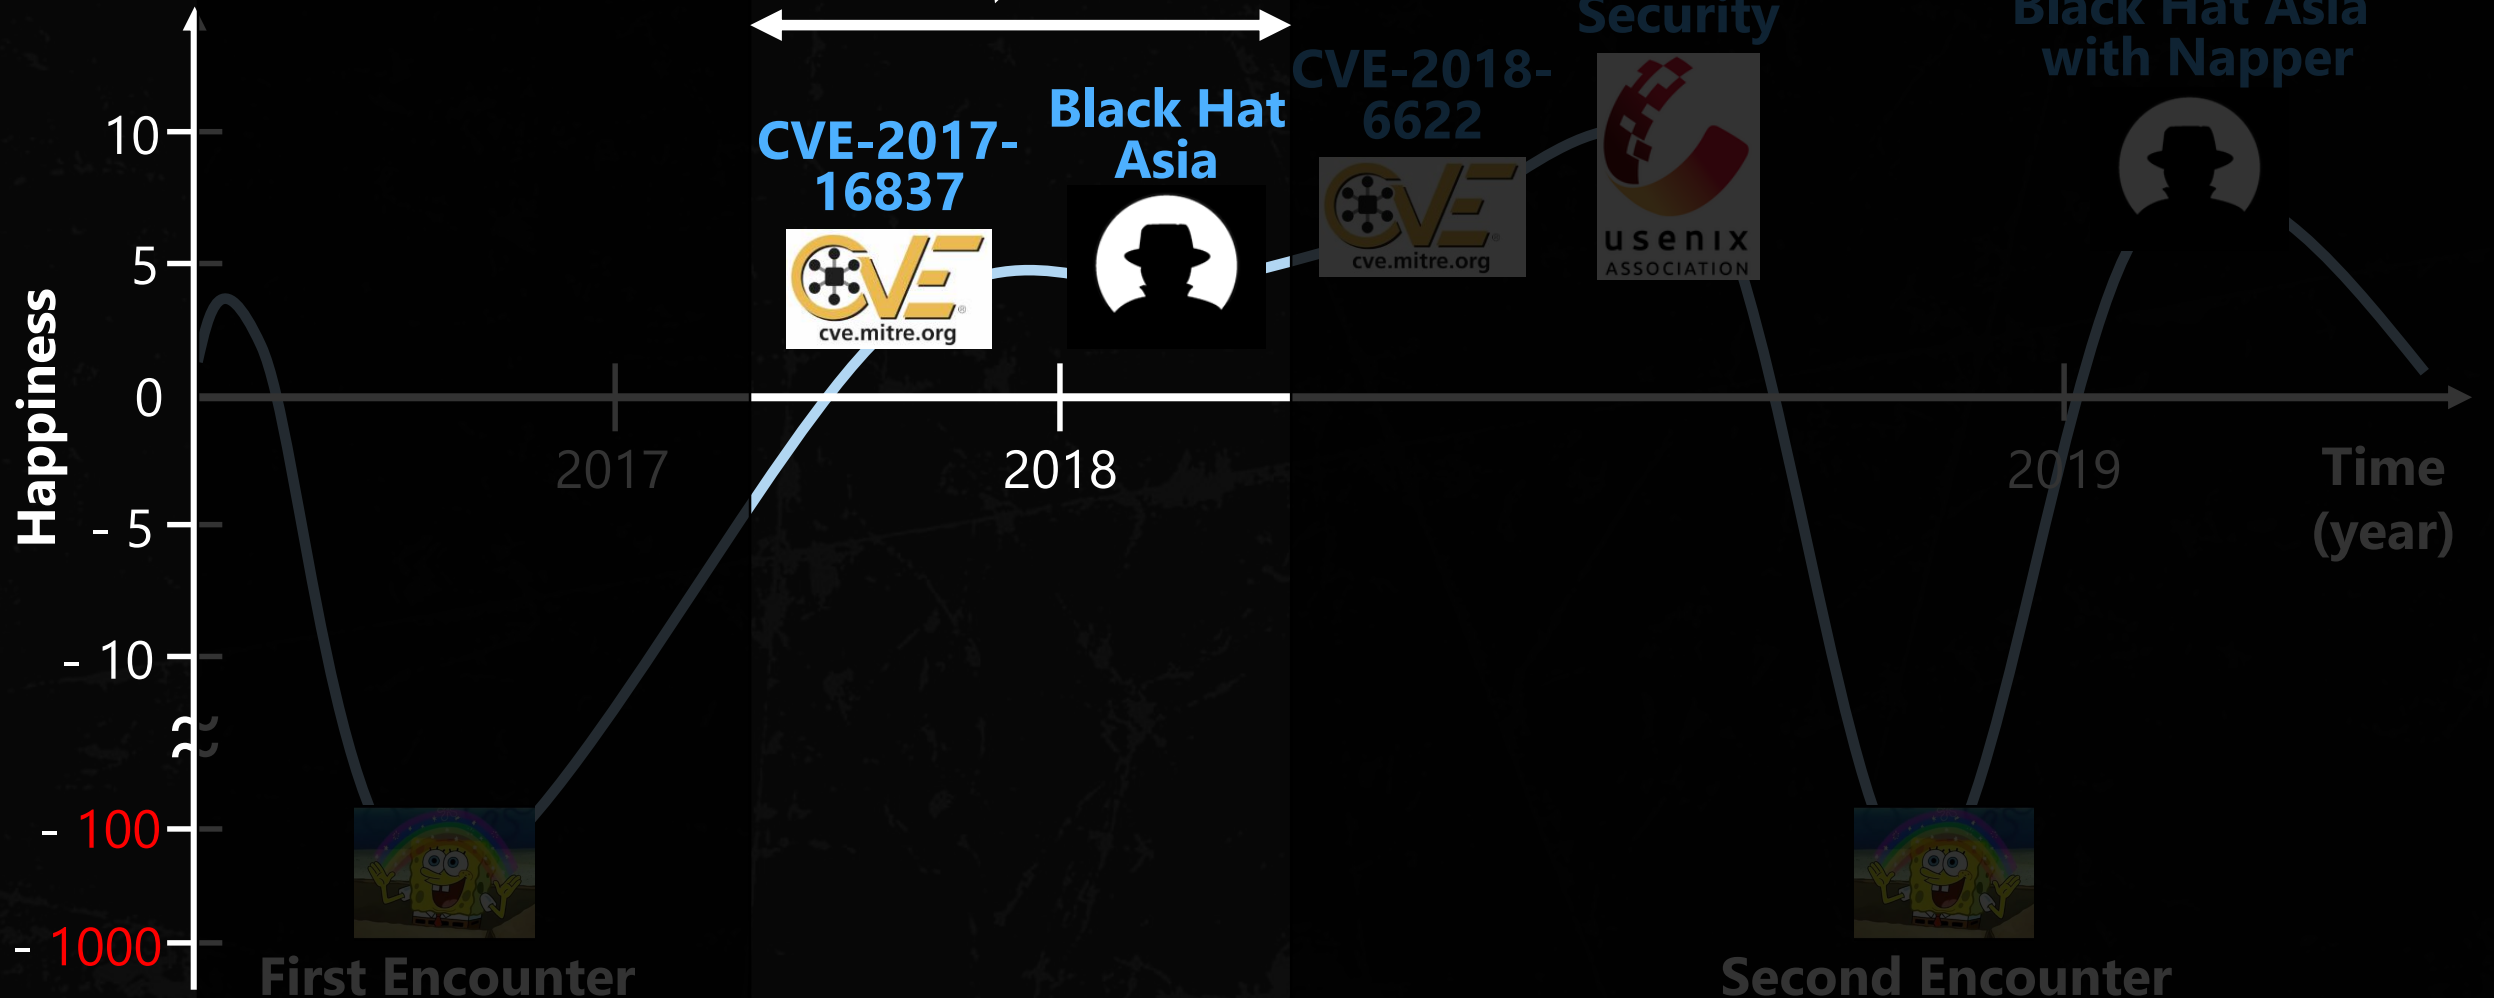
We trust [illegible]chanisms
becaus[illegible]**TION**!

Fortu[illegible]orked!



UNTIL I PUBLISHED
THE VULNERABILITIES!

Contents - CVE-2017-16837



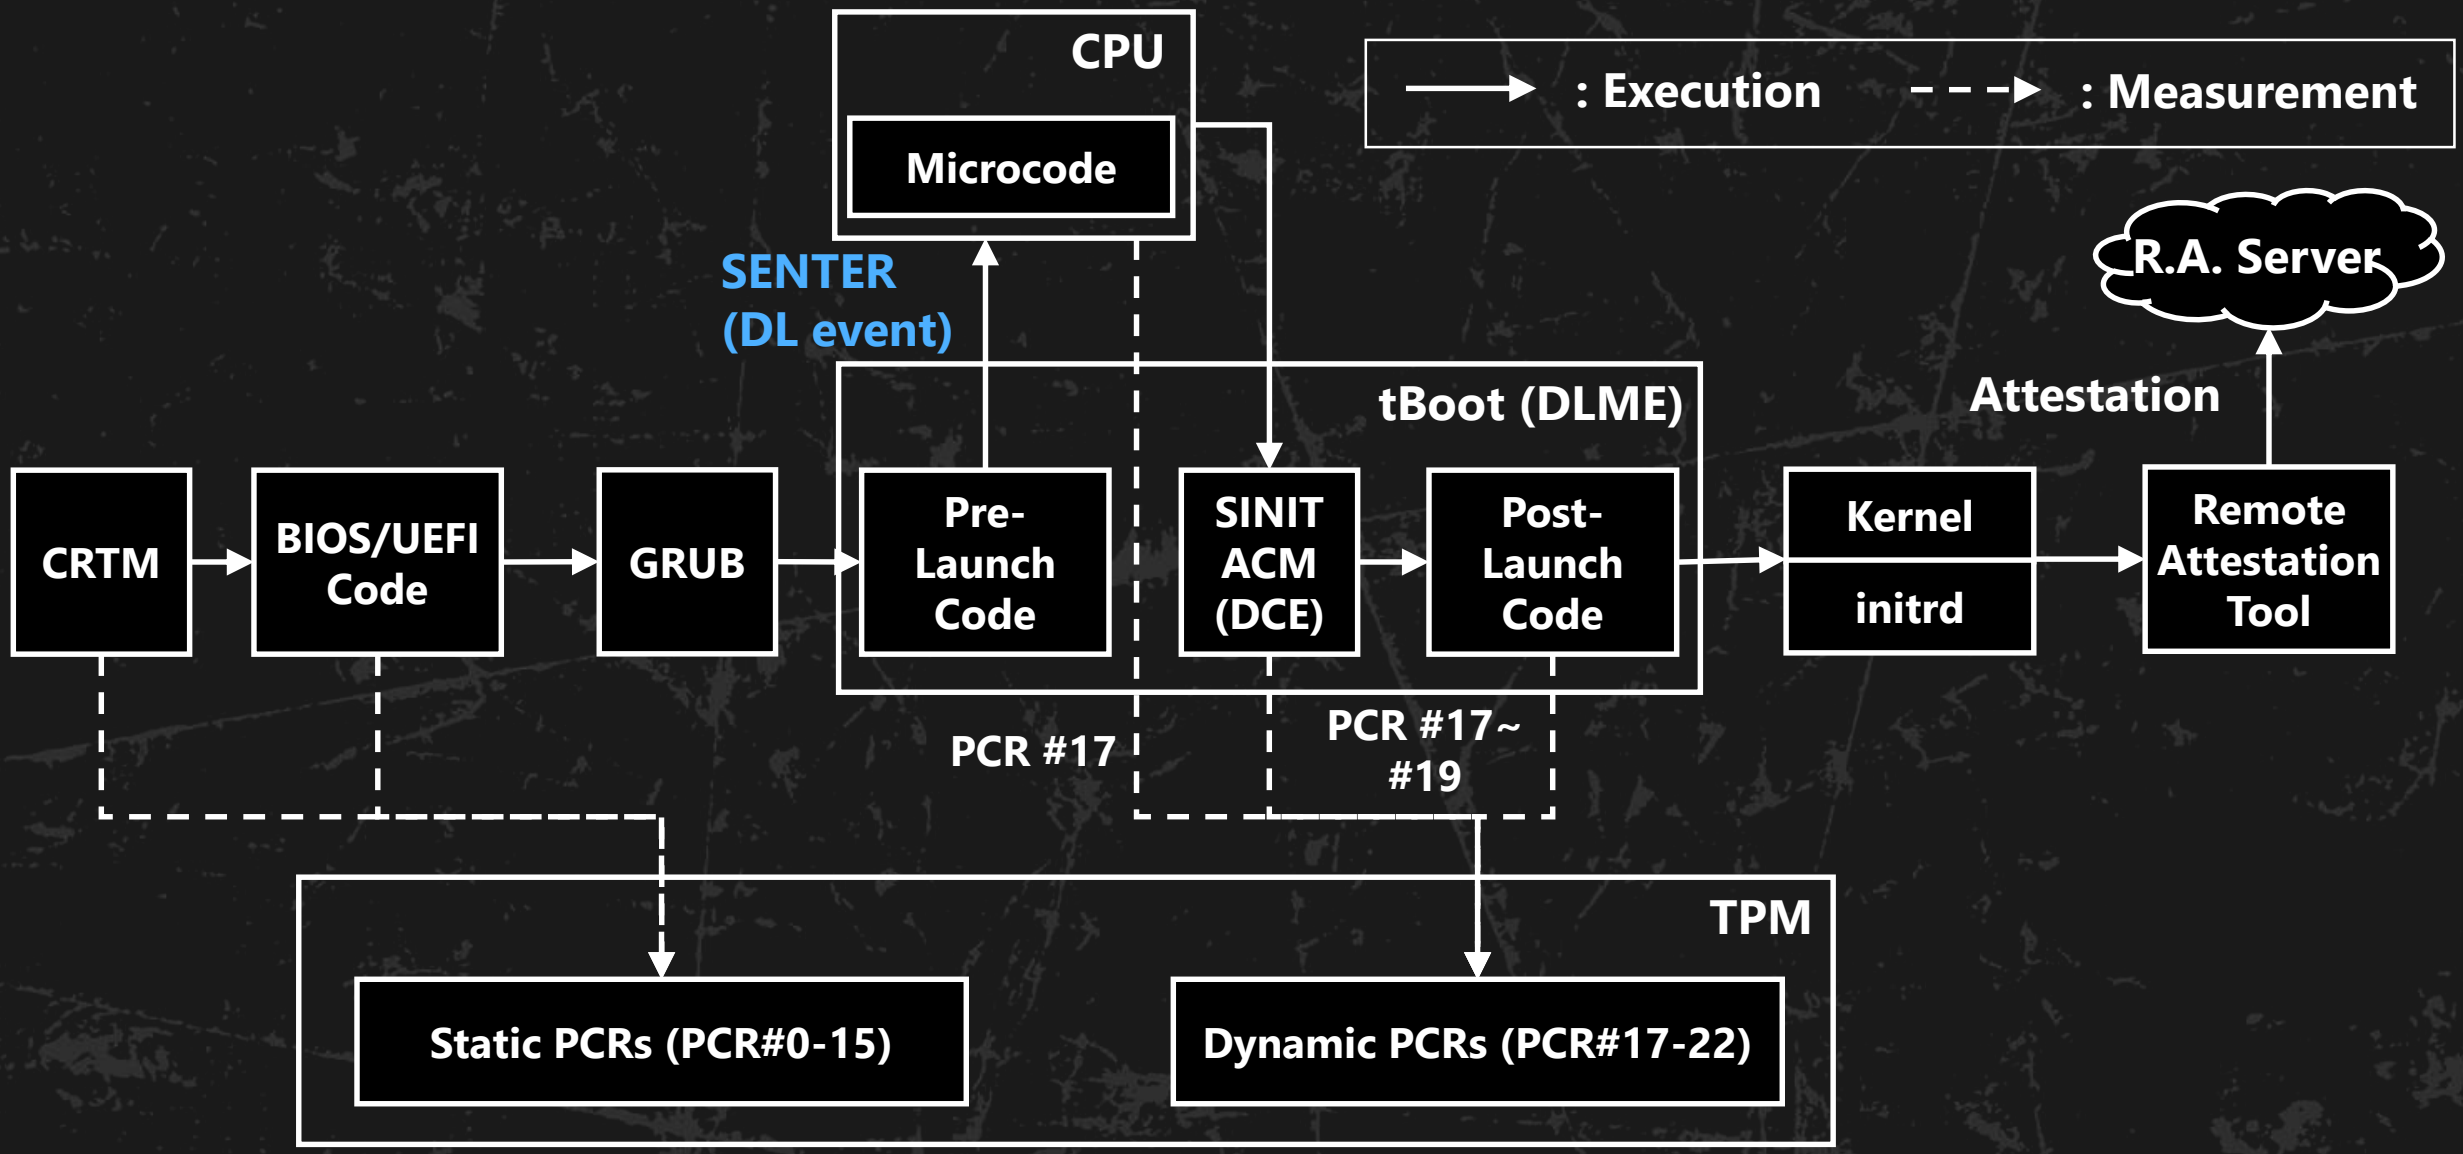
Intel Trusted Execution Environment (TXT)

- **Is the DRTM technology of TCG specification**
  - Intel just uses their own terminologies
  - ex) DCE = Secure Initialization Authenticated Code Module (SINIT ACM)
    DLME = Measured Launched Environment (MLE)
- **Has special commands (SENTER and SEXIT) to enter trustworthy state and exit from it**
  - SENTER checks if SINIT ACM has a valid signature
  - Intel publishes SINIT ACM on the website

Trusted Boot (tBoot)

- **Is a reference implementation of Intel TXT**
  - It is an open source project (https://sourceforge.net/projects/tboot/)
  - It has been included many Linux distros such as RedHat, SUSE, and Ubuntu
- **Can verify OS and Virtual Machine Monitor (VMM)**
  - It measures OS components and stores hashes to the TPM
  - Measured results in PCRs of the TPM can be verified by a remote attestation server such as Intel Open CIT
  - It is typically used in server environments

Boot Process of tBoot



Boot process is perfect! (maybe)

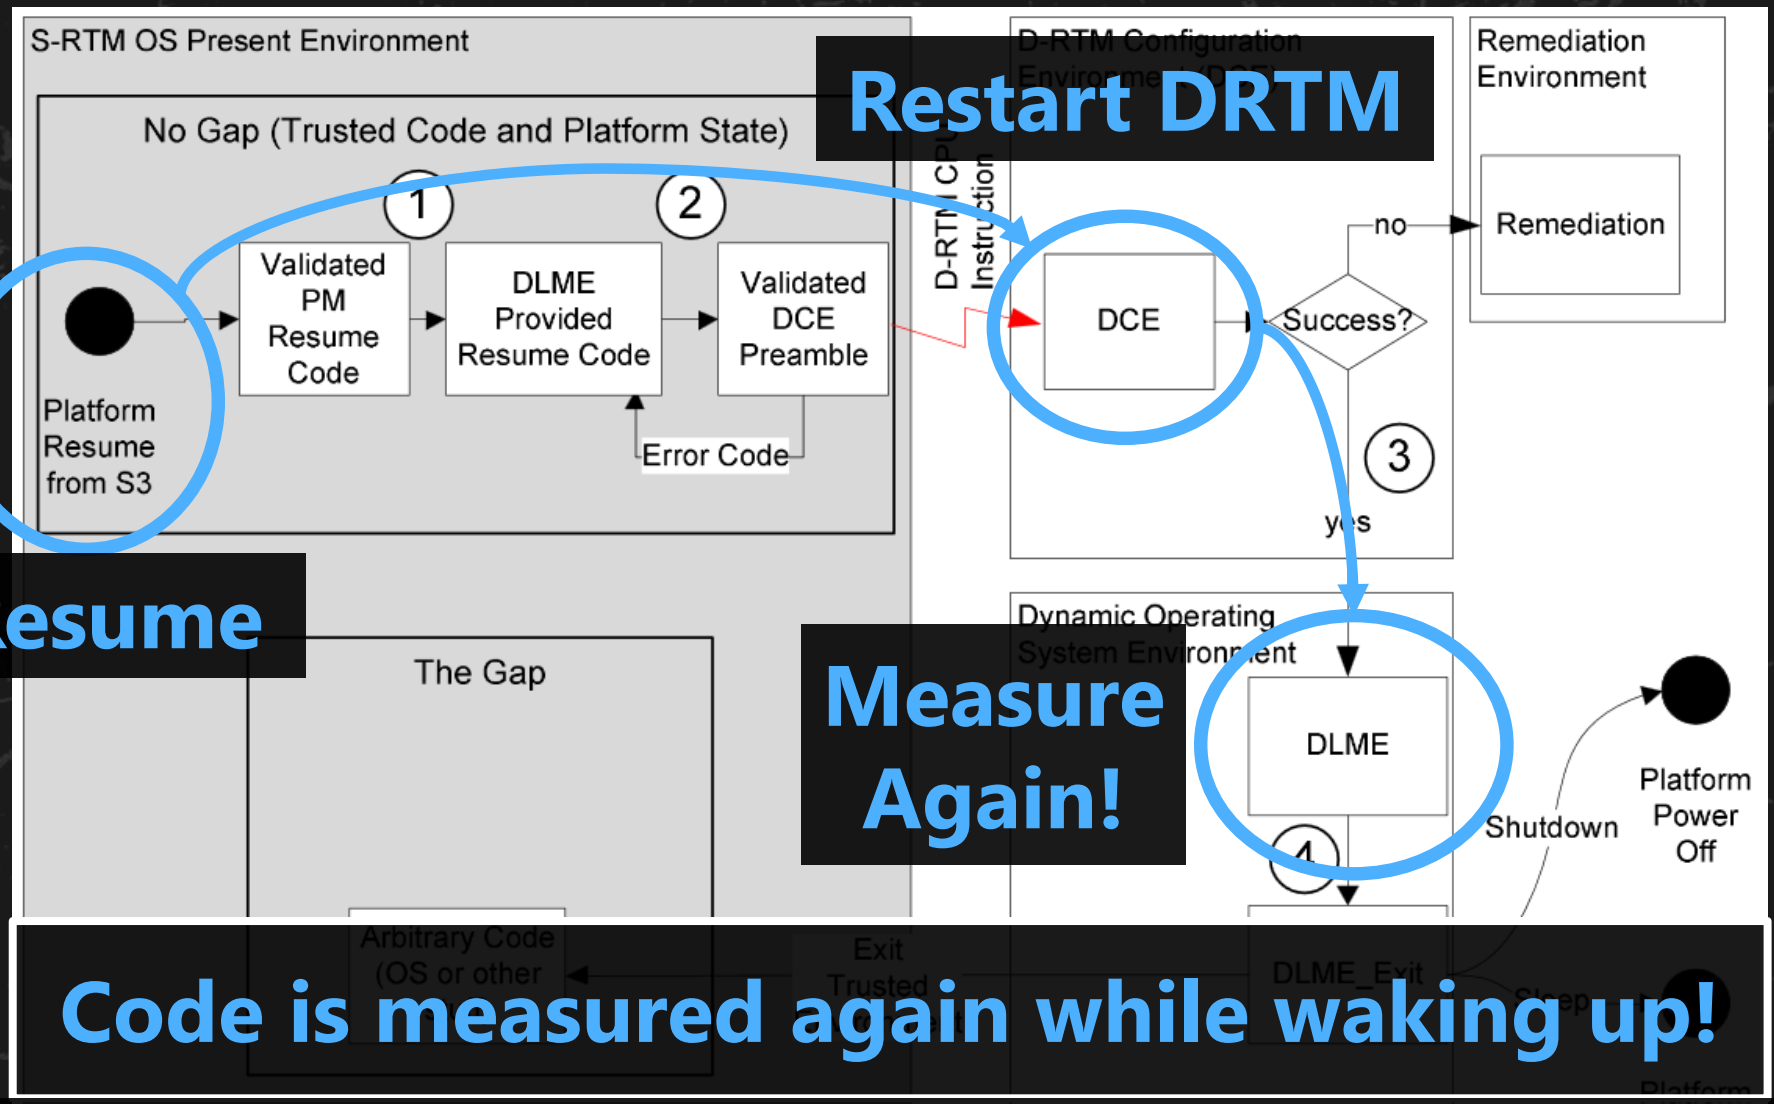
How about sleep process?

Advanced Configuration and Power Interface (ACPI) and Sleeping States

- **Cut off the power of…**
  - S0: Normal, no context is lost
  - S1: Standby, the CPU cache is lost
  - S2: Standby, the **CPU** is **POWERED OFF**
  - S3: Suspend, **CPU and devices** are **POWERED OFF**
  - S4: Hibernate, the **CPU, devices, and RAM** are **POWERED OFF**
  - S5: Soft Off, all parts are **POWERED OFF**

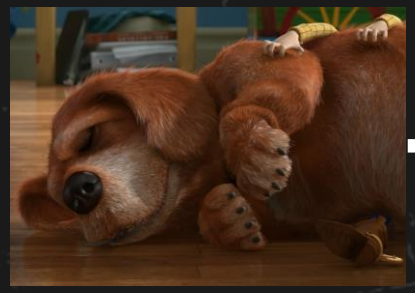
TPM is also POWERED OFF!

Waking Up Process of the DRTM



<TCG D-RTM Architecture Specification>

Sleep Process with tBoot



Seal S3 key and MAC of Kernel Memory with Post-Launch PCRs
- seal_post_k_state() → g_tpm->seal()

Save Static PCRs(0~16)
- tpm->save_state()

Shutdown Intel TXT
- txt_shutdown()

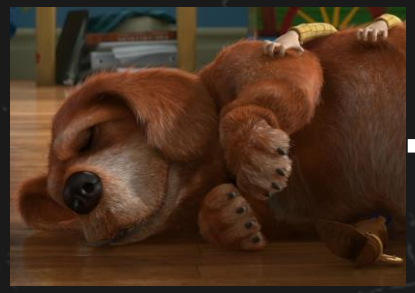
Sleep. Power off the CPU and the TPM!
- shutdown_system()

Wake Up, Restore Static PCRs, and Resume tBoot
- Real Mode, Single CPU

Launch MLE again and then, Unseal S3 key and MAC with P-Launch PCRs
- begin_launch() → txt_s3_launch_environment()
- post_launch() → s3_launch() → verify_integrity() → g_tpm->unseal()

Extend PCRs and Resume Kernel
- verify_integrity() → extends_pcrs() → g_tpm→extend()
- s3_launch()-> prot_to_real()

Sleep Process with tBoot



- Seal S3 key and MAC of Kernel Memory with Post-Launch PCRs
  - seal_post_k_state() → g_tpm->seal()
- Save Static PCRs(0~16)
  - tpm->save_state()
- Shutdown Intel TXT
  - txt_shutdown()
- Sleep. Power off the CPU and the TPM!
  - shutdown_system()
- Wake Up, Restore Static PCRs, and Resu
  - Real Mode, Single CPU
- Launch MLE again and then, Unseal S3 PCRs
  - begin_launch() → txt_s3_launch_environment()
  - post_launch() → s3_launch() → verify_integrity() → g_t>unseal()
- Extend PCRs and Resume Kernel
  - verify_integrity() → extends_pcrs() → g_tpm→extend()
  - s3_launch()-> prot_to_real()

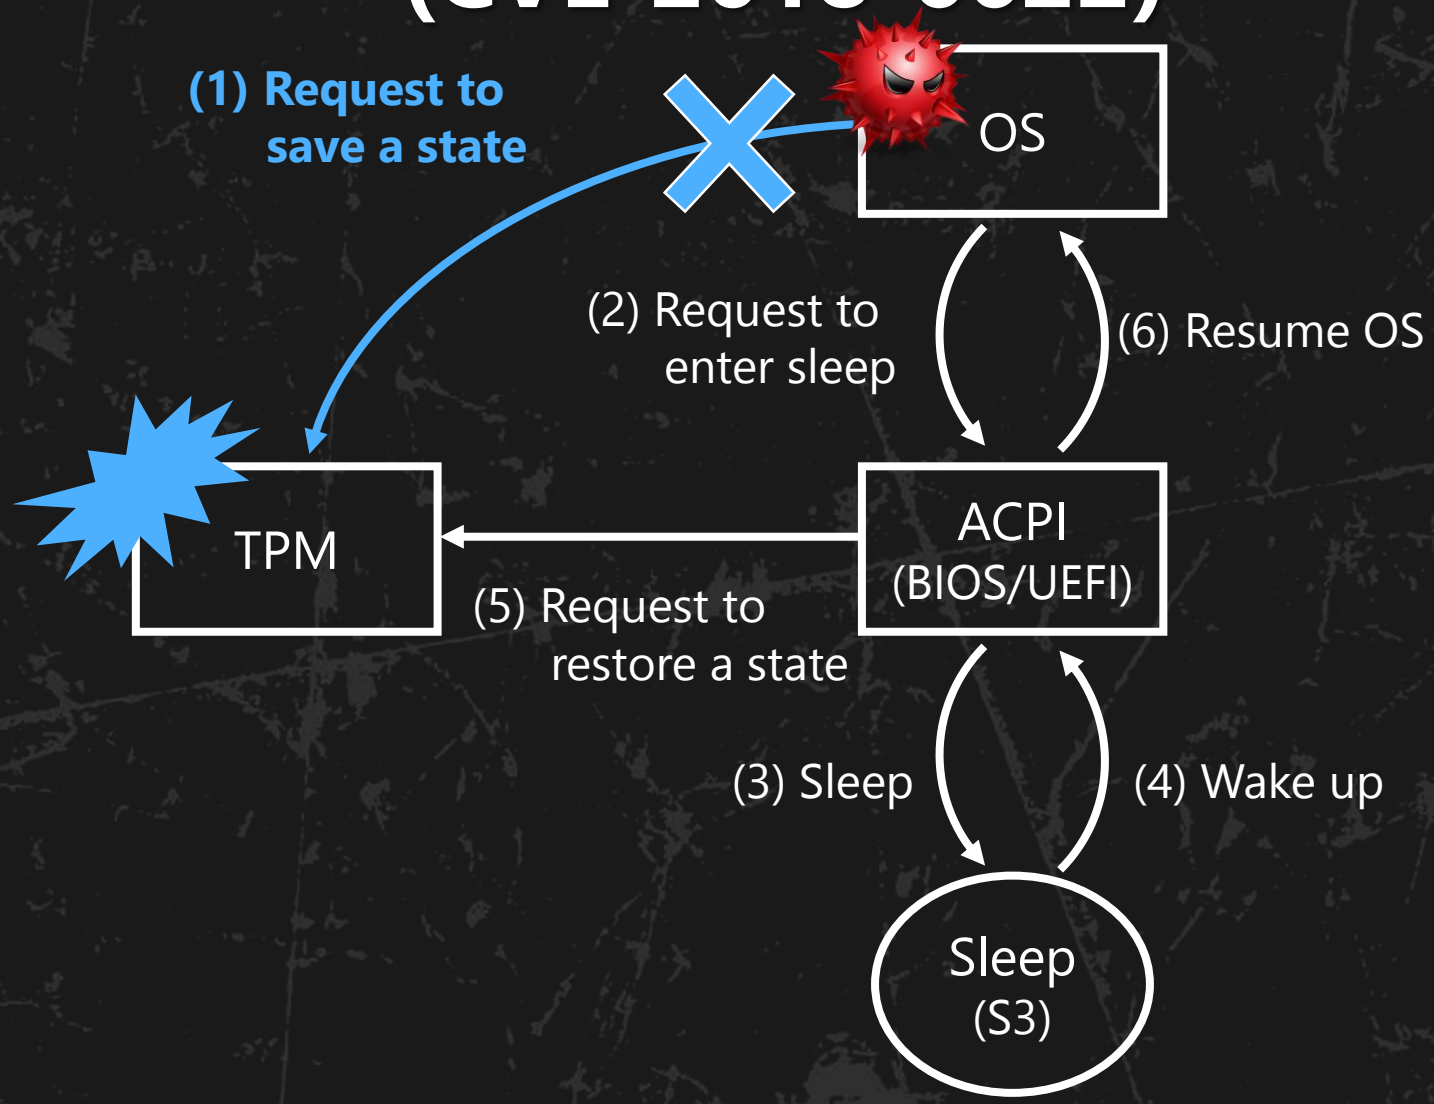
“Grey Area” Vulnerability (1) (CVE-2018-6622)



<TCG PC Client Platform Firmware Profile Specification>

“Grey Area” Vulnerability (2) (CVE-2018-6622)

TPM 2.0

What is the “corrective action”?

If the TPM receives Startup(STATE) that was not preceded by Shutdown(STATE), then there is no state to restore and the TPM will return TPM_RC_VALUE. The CRTM is expected to take corrective action to prevent malicious software from manipulating the PCR values such that they would misrepresent the state of the platform. The CRTM would abort the Startup(State) and restart with Startup(CLEAR).

This means “reset the TPM”

TPM 1.2

The startup behavior defined by this specification is different than TPM 1.2 with respect to Startup(STATE). A TPM 1.2 device will enter Failure Mode if no state is available when the TPM receives Startup(STATE). This is not the case in this specification. It is up to the CRTM to take corrective action if it the TPM returns TPM_RC_VALUE in response to Startup(STATE).

<Trusted Platform Module Library Part1: Architecture Specification>

I have no idea about “corrective action”

I should do nothing!

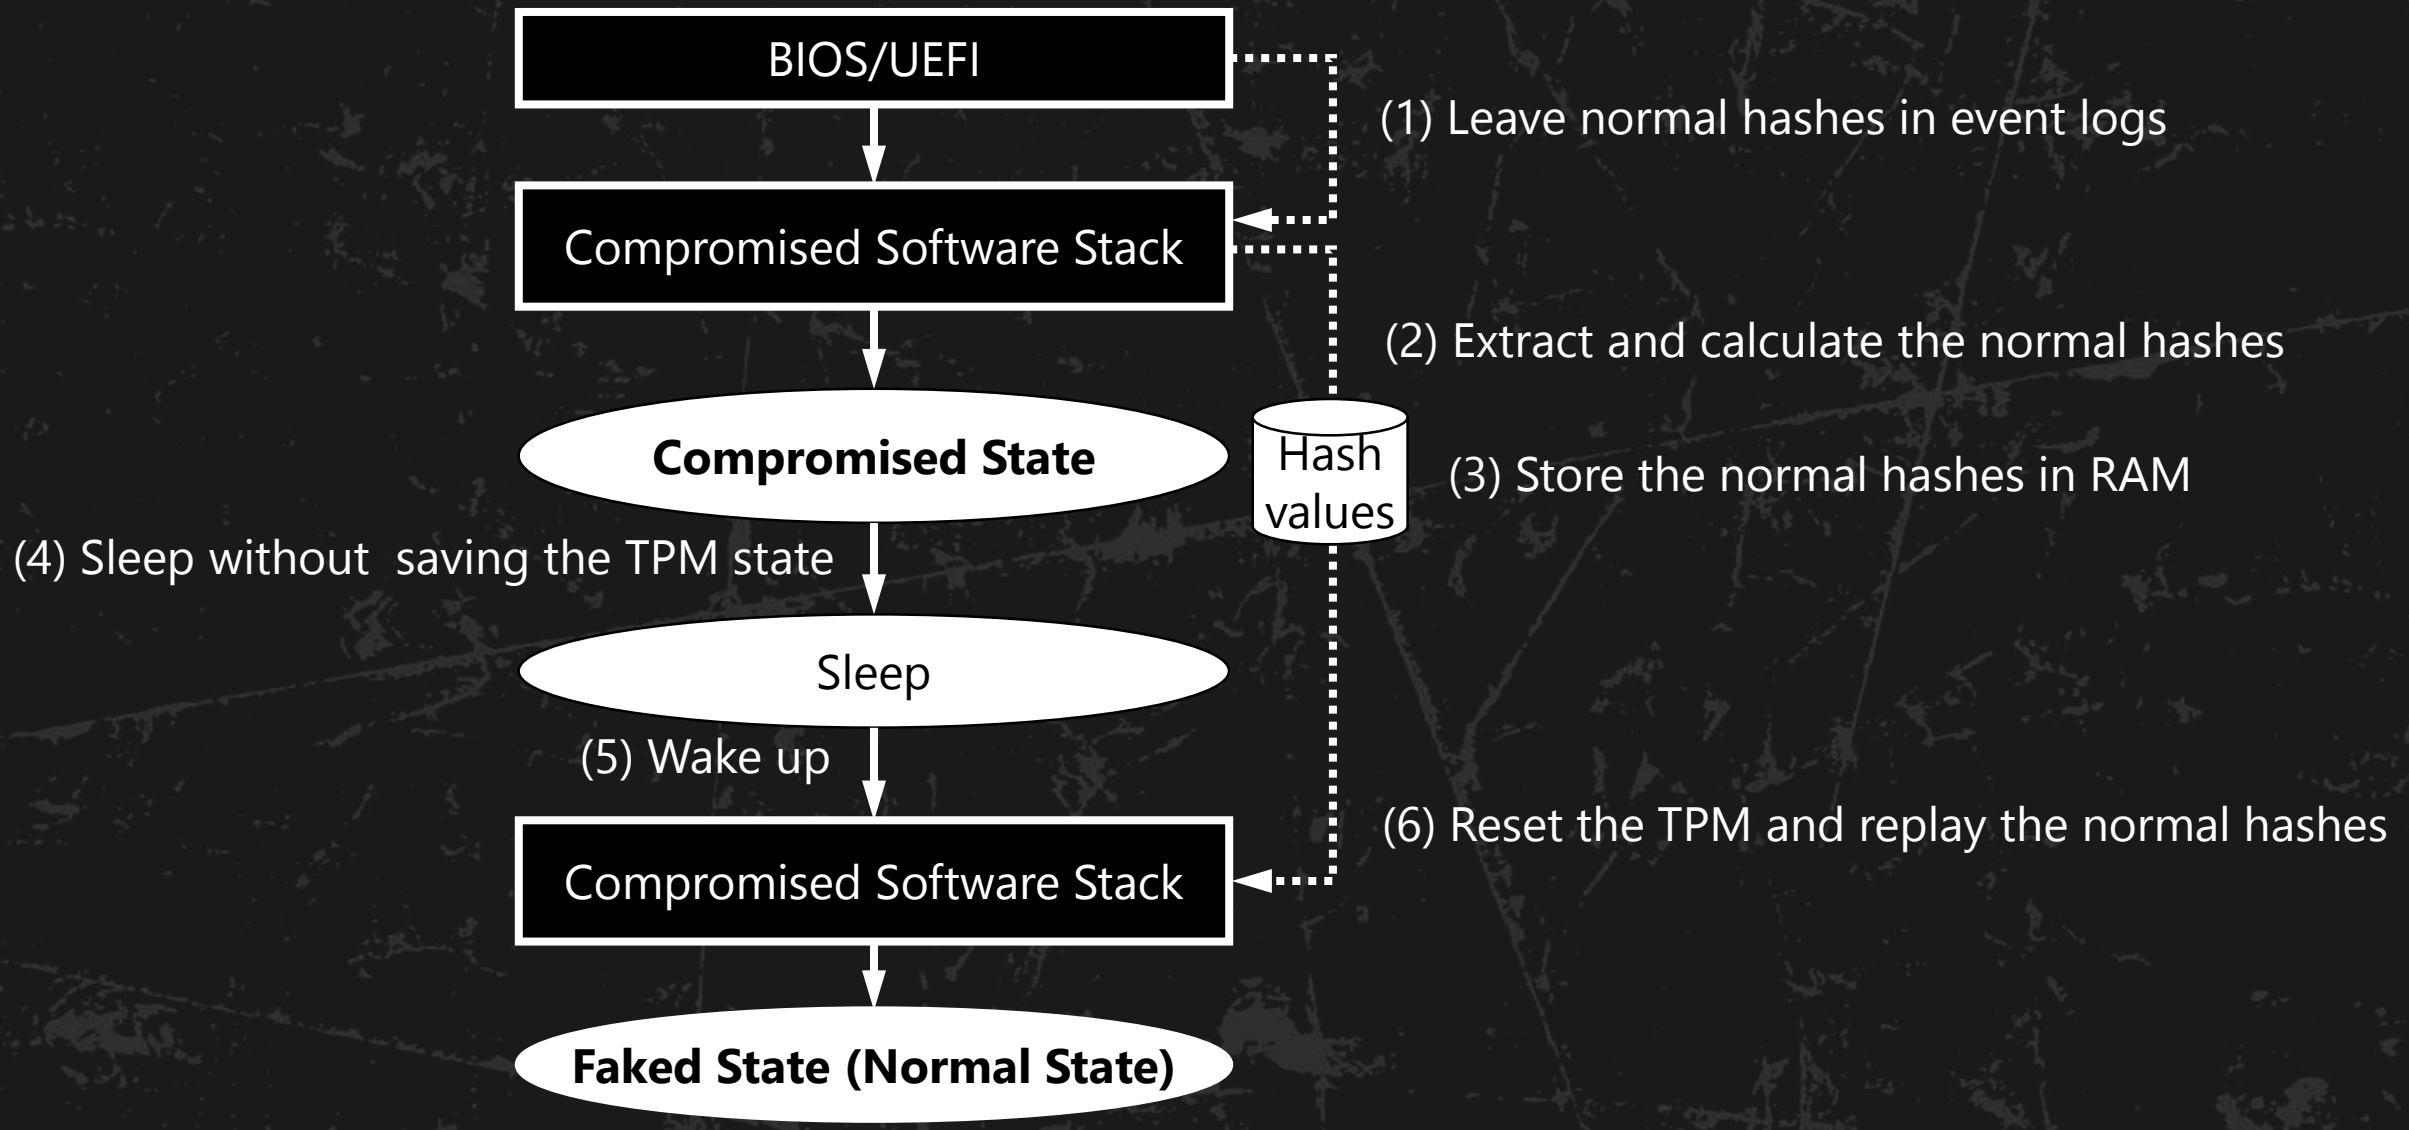
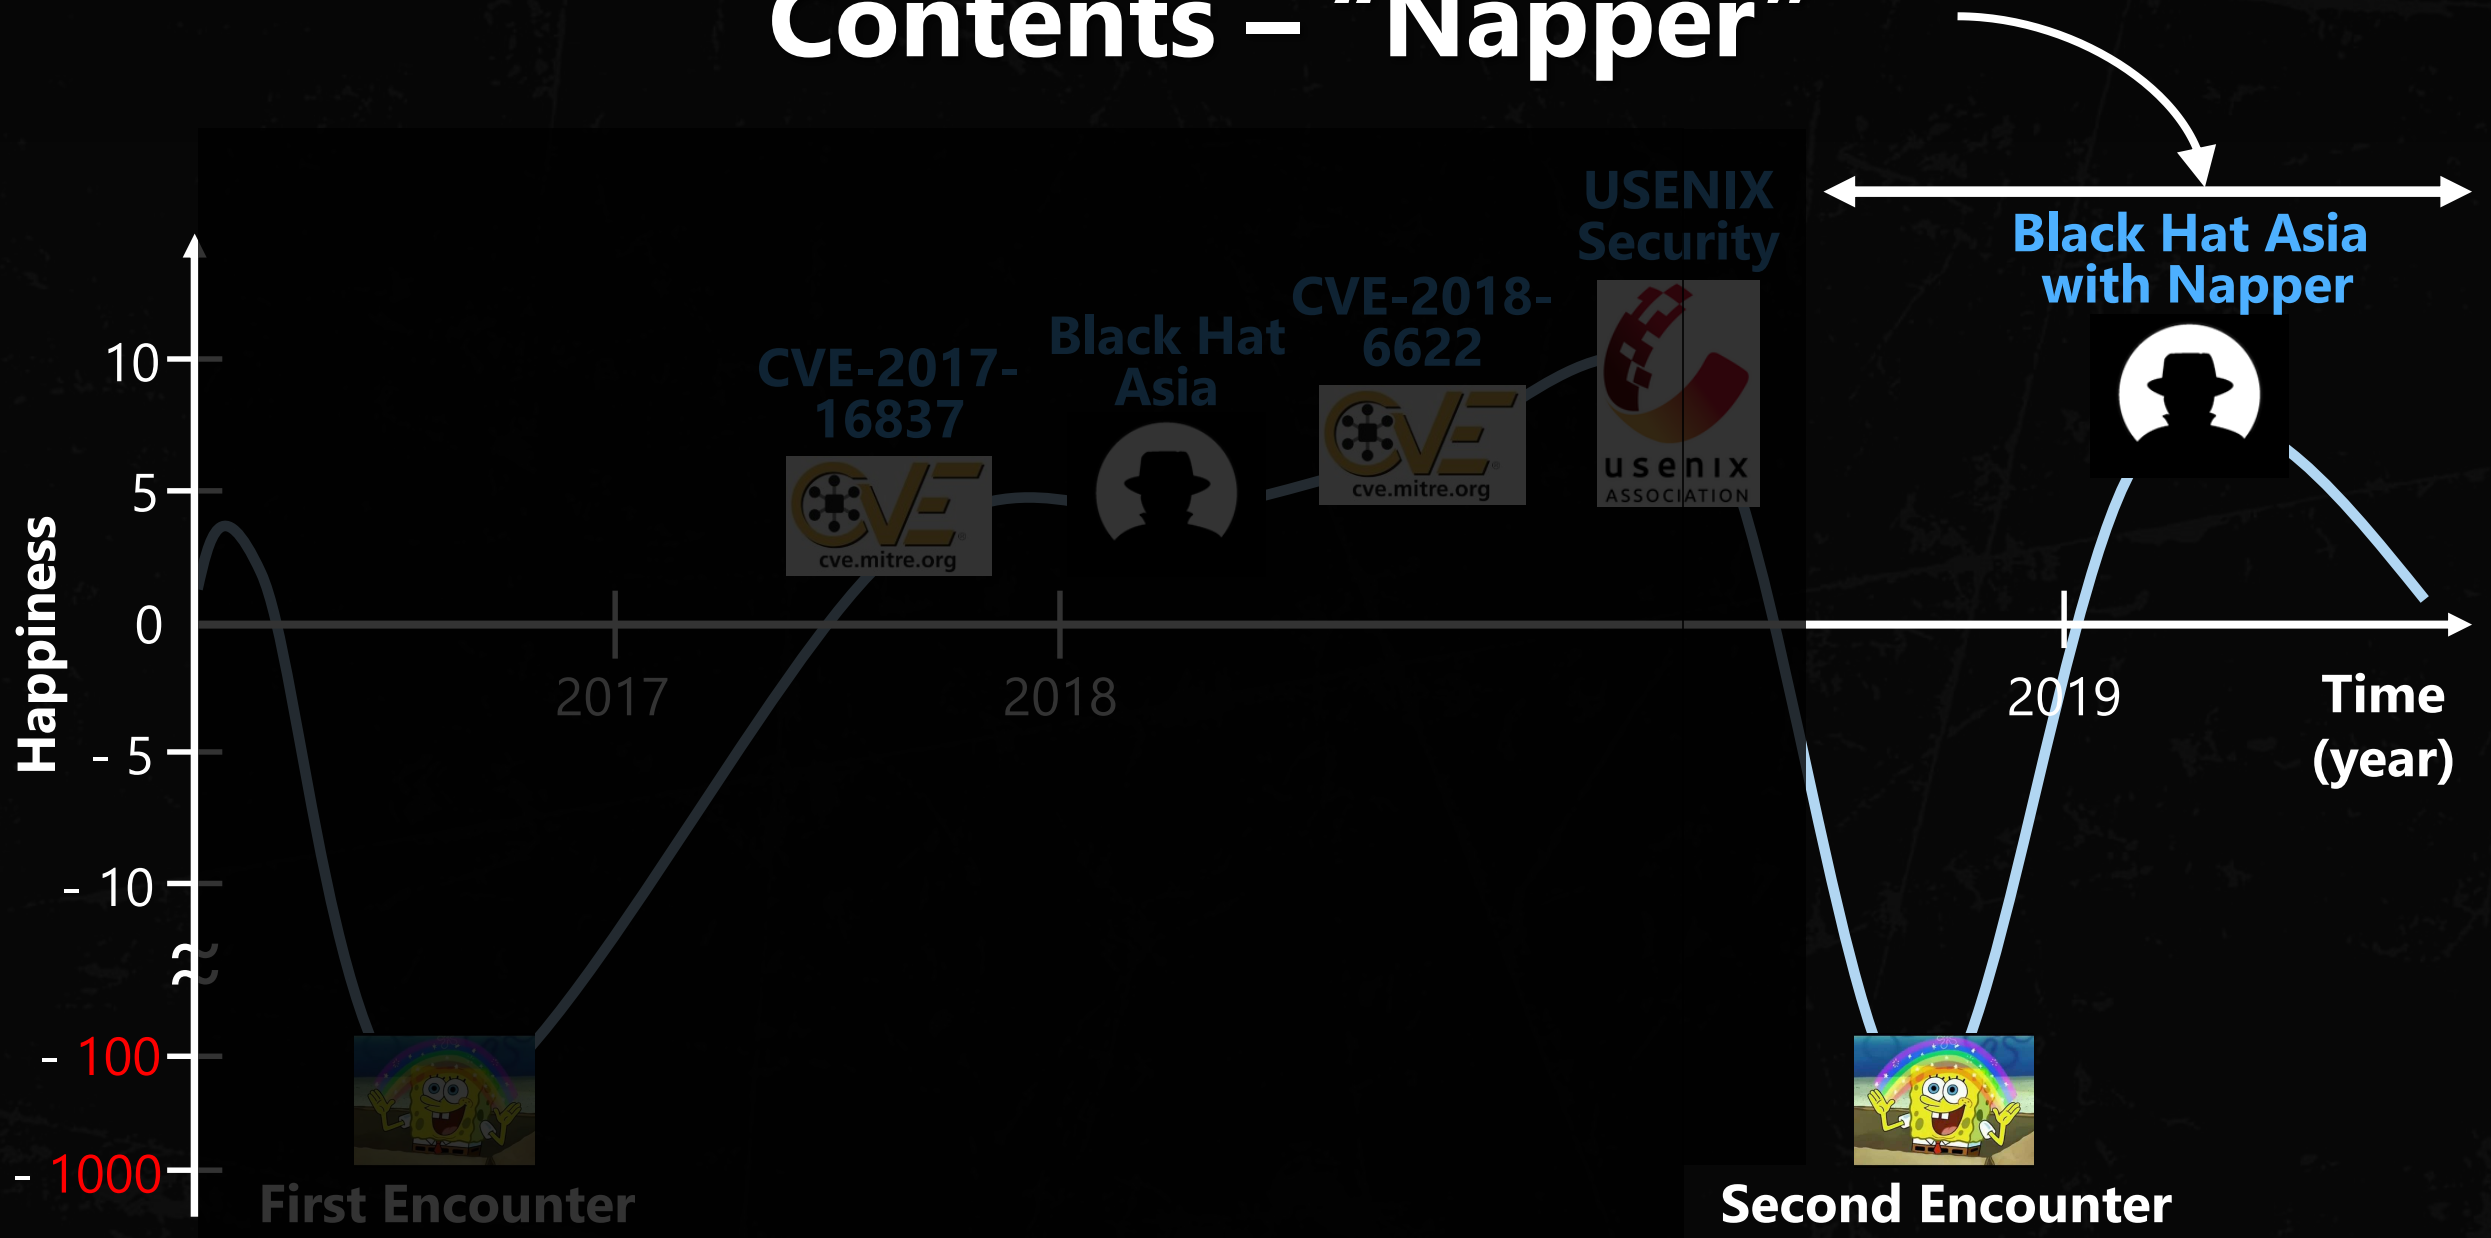
Clear!

Exploit Scenario of the CVE-2018-6622



Contents – “Napper”



Second Encounter!!!

“Napper”?

- **Is a tool that can check the ACPI S3 sleep mode vulnerability in the TPM**
  - It is a bootable USB device based-on Ubuntu 18.04
  - It has a **kernel module** and **user-level applications**
- **Makes the system take a nap and checks the vulnerability**
  - The kernel module exploits the grey area vulnerability (CVE-2018-6622) while sleeping by patching kernel code
  - The user-level applications check the TPM status and show a report

“Napper”?

- **Is a tool that can check the ACPI S3 sleep mode vulnerability in the TPM**
  - It is a bootable USB device based-on Ubuntu 18.04
  - It has a **kernel module** and **user-level applications**
- **Makes the system take a nap and checks the vulnerability**

CVE-2017-16837 is a software vulnerability!
Upgrade tBoot if the version is lower than v1.9.7

Napper's Kernel Module (1)

- **Patches the tpm_pm_suspend() function in TPM driver**
  - The function is invoked by kernel while S3 sleep sequence
  - The kernel module changes the function to "**return 0;**"

```
1  int tpm_pm_suspend(struct device *dev)
2  {
3      struct tpm_chip *chip = dev_get_drvdata(dev);
4      struct tpm_cmd_t cmd;
5      int rc, try;
6
7      u8 dummy_hash[TPM_DIGEST_SIZE] = { 0 }
8
9      if (chip == NULL)
10         return -ENODEV;
11
12     if (chip->flags & TPM_CHIP_FLAG_ALWAYS
13         return 0;
14
15     if (chip->flags & TPM_CHIP_FLAG_TPM2) {
16         tpm2_shutdown(chip, TPM2_SU_STATE);
17         return 0;
18     }
```

```
1  int tpm_pm_suspend(struct device *dev)
2  {
3      // Do nothing!
4      return 0;
5  }
```

Napper's Kernel Module (2)

```
1  static int __init napper_init(void)
2  {
3      TEXT_POKE fn_text_poke;
4      unsigned long tpm_suspend_addr;
5
6      // Byte code of "XOR RAX, RAX; RET;"
7      unsigned char ret_op_code[] = {0x48, 0x31, 0xC0, 0xC3};
8      unsigned char org_op_code[sizeof(ret_op_code)];
9
10     // Find needed functions
11     fn_text_poke = (TEXT_POKE) kallsyms_lookup_name("text_poke");
12     tpm_suspend_addr = kallsyms_lookup_name("tpm_pm_suspend");
13
14     // Backup code and patch it
15     memcpy(org_op_code, (unsigned char*) tpm_suspend_addr, sizeof(org_op_code));
16     fn_text_poke((void*) tpm_suspend_addr, ret_op_code, sizeof(ret_op_code));
17
18     return 0;
19 }
```

Napper's User-Level Applications

- **Consist of TPM-related software and launcher software**
  - I added a command-line tool, "tpm2_extendpcrs", to tpm2_tools
  - I also made a launcher software for easy-of-use
- **Load the kernel module and check the TPM vulnerability**
  - The launcher loads napper's kernel module and takes a nap
  - It checks if **PCRs of the TPM are all ZEROS** and extends PCRs
  - It gathers and reports the TPM and system information with tpm2_getinfo, dmidecode, and journalctl tools

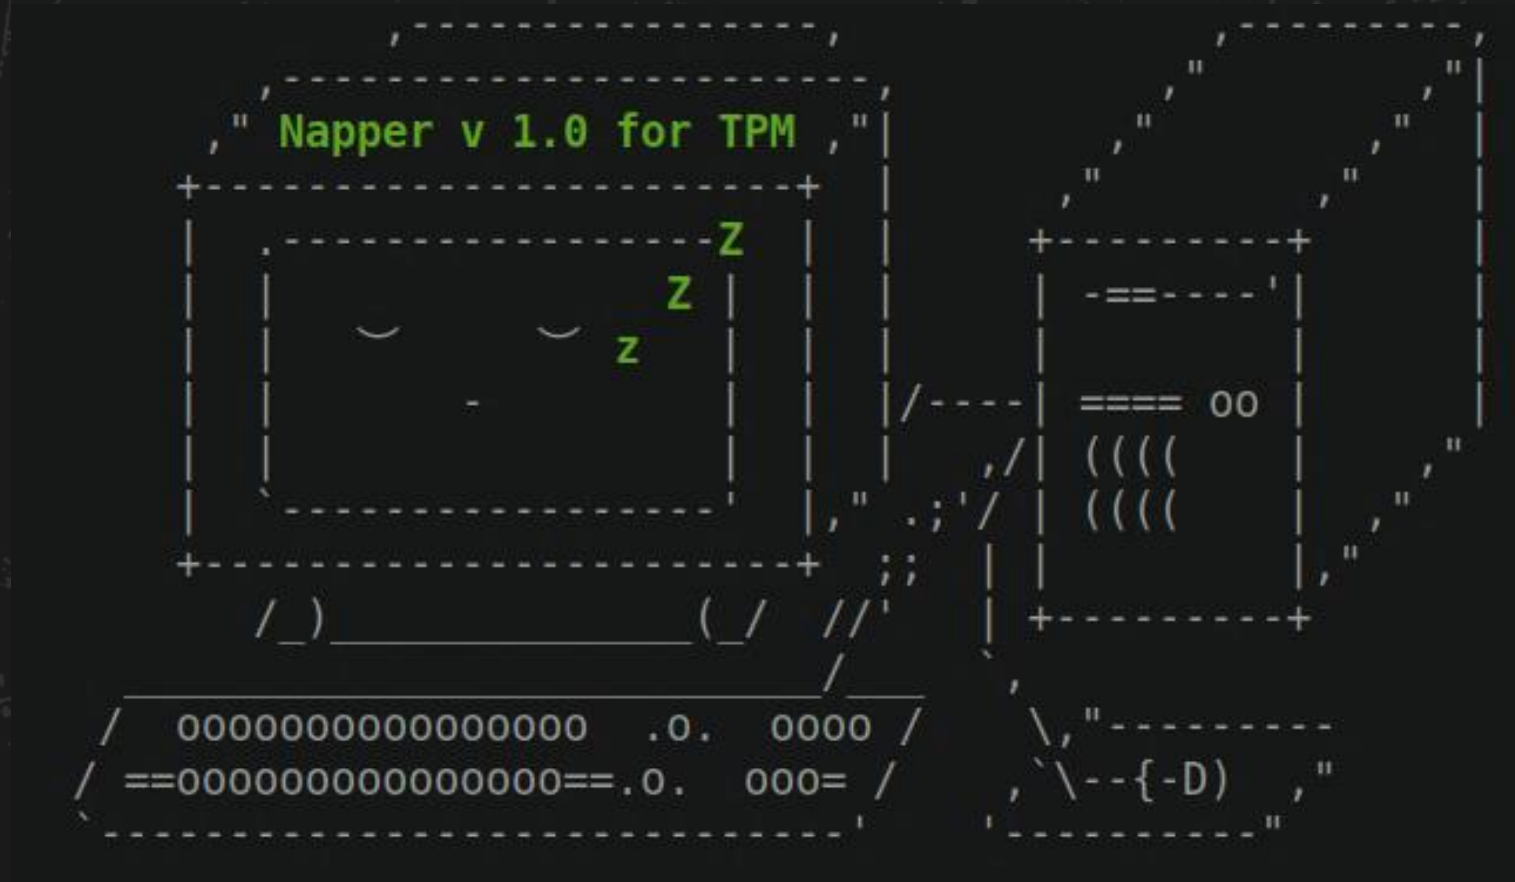
Demo

Napper tool



Countermeasures – CVE-2018-6622
(The Grey Area Vulnerability)

1) **Disable the ACPI S3 sleep feature in BIOS menu**
   - Brutal, but simple and effective
2) **Revise TPM 2.0 specification to define "corrective action" in detail and patch BIOS/UEFI firmware**
   - A long time to revise and apply to the TPM or BIOS/UEFI firmware
   - But, fundamental solution!

Check and update your BIOS/UEFI firmware!

Countermeasures – CVE-2017-16837
(The Lost Pointer Vulnerability)

1) **Apply my patch to tBoot**
   - https://sourceforge.net/p/tboot/code/ci/521c58e51eb5be105a29983742850e72c44ed80e/
2) **Update tBoot to the latest version**

Conclusion

- **Until now, we have trusted the untrustable hardware and software with reputation!**
  - “Reputation” is not “Trustworthiness”
  - Trust nothing only with reputation and check everything for yourself
- **Napper helps you to check the TPM vulnerability**
  - Check your system with Napper or visit the project site for the results
- **Update your BIOS/UEFI firmware with the latest version**
  - If there is no patched firmware yet, disable the ACPI S3 sleep feature in BIOS menu right now!
